

TA8227AP**LINEAR INTEGRATED CIRCUIT****LOW FREQUENCY POWER AMPLIFIER****■ DESCRIPTION**

The UTC TA8227AP is an audio power IC with built-in two channels developed for portable radio cassette tape recorder with power ON / OFF switch.

Thermal shut down protection circuit is built in.

DIP-12H

SOP-20

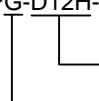

■ FEATURES

- * Wide operating supply voltage: $V_{CC}=5\sim 12V$
- * Low popping noise at power ON
- * Best for supply voltage 9V
- * Output power
 - $P_{OUT}=2.5W/CH$ at $V_{CC}=9V$, $R_L=4\Omega$, $f=1kHz$, THD=10%
 - $P_{OUT}=3.0W/CH$ at $V_{CC}=9V$, $R_L=3\Omega$, $f=1kHz$, THD=10%
- * Soft Clip
- * Built-in thermal shut-down protection circuit
- * Stand-by switch

■ APPLICATION INFORMATION AND APPLICATION METHOD

1. Adjustment of voltage gain

The voltage gain Gv is obtained as follows by R1, R2 and Rf in Fig.1

$$G_V = 20 \log \frac{R_f + R1 + R2}{R_f + R1}$$

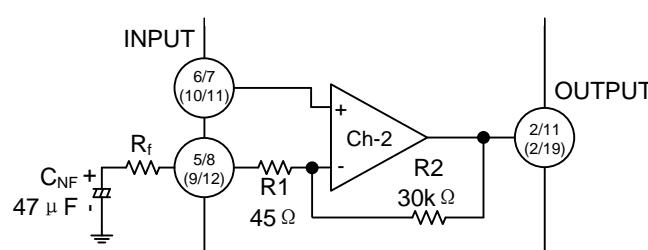

When $R_f = 0\Omega$

$G_V=56.5 \text{ dB}$ (Typ.)

When $R_f = 120\Omega$

$G_V=45 \text{ dB}$ (Typ.)

By increasing Rf, reduction of Gv is possible. However, since the feedback increase is liable to produce oscillation, it is recommended to use this at 40dB or over.

2. Thermal shut-down circuit

The thermal shut-down circuit is built in for the purpose of preventing the destruction of IC due to the abnormal temperature rise when the heat radiation is insufficient.

The operation temperature is set at radiation Fin temperature 175°C (Typ.)

At this temperature or over the bias is interrupted to prevent the destruction of IC.

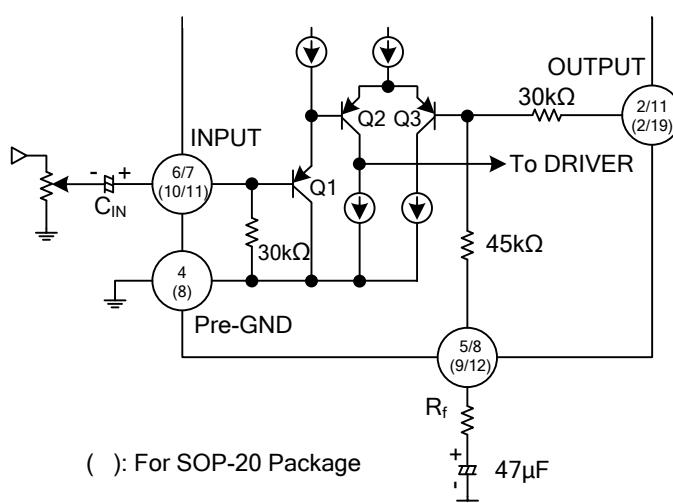

3. Input stage

The input circuit of this IC is as shown in fig.2. PNP Tr : Q1 is provided in the input circuit so as to make its usage possible without the input coupling capacitor.

However, at pin 6 and pin 7, max 60mV offset voltage is produced.

Application after checking volume slide noise is recommended.

For cutting the volume slide noise, insert the input capacitor: CIN in series to interrupt the DC component.

4. Oscillation preventive measures

For oscillation preventive capacitor C6 and C7 between the output terminal and GND, it is recommended to use polyester film capacitor having good characteristics for temperature and for high frequency.

Since the characteristics of the capacitor is liable to be influenced by the temperature, use this capacitor after the temperature test to check the oscillation allowance.

In addition, as the position of the electrolytic capacitor has a remarkable influence on the oscillation, connect C10 to Vcc at the nearest possible position from power GND.

At using this application wth the voltage gain reduced, oscillation is liable to be produced. Apply the capacitor after checking enough for its capacity, type and mounting position.

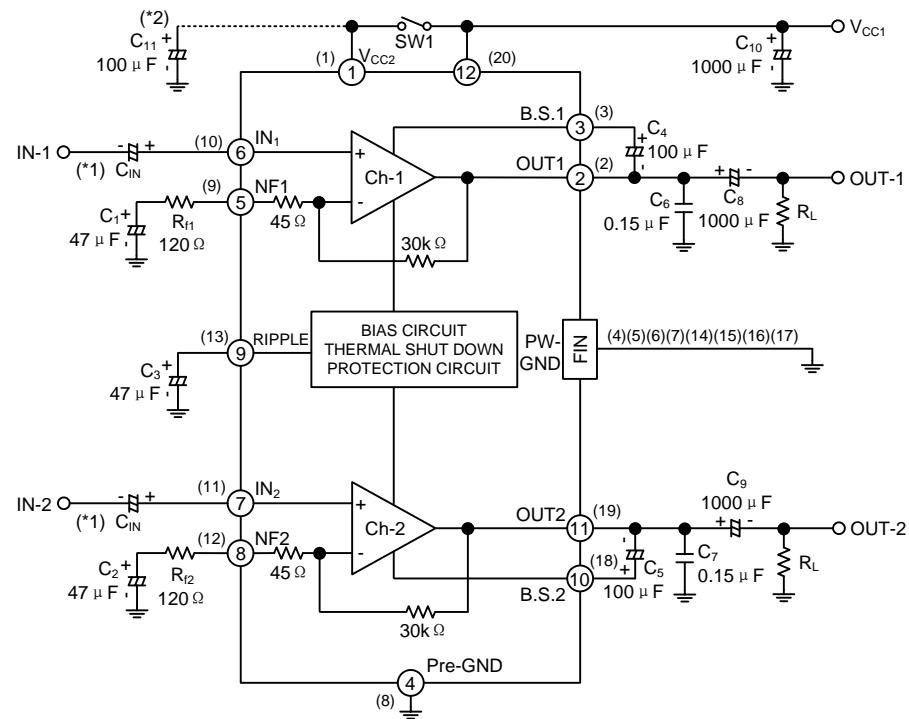

5. Power ON / OFF switch

There is power ON / OFF switch at Pin1. However, output power is changed by Pin1 supply voltage when Pin1 supply voltage is not same Pin12 supply voltage, after referring to attached date, select Pin1 supply voltage.

6. Input voltage

When the excessive signal is input, turning-up is produced in the clip waveform. The turning-up point is $V_{IN}=300mV_{rms}$ (Typ.) : $V_{CC}=9V$, $RL=4\Omega$, $f=1kHz$: Enough care must be taken for this phenomenon.

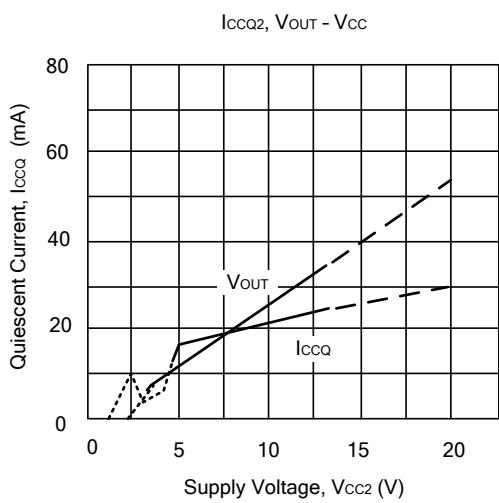

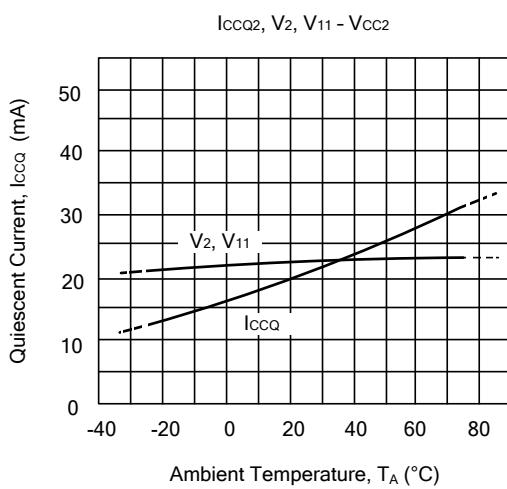

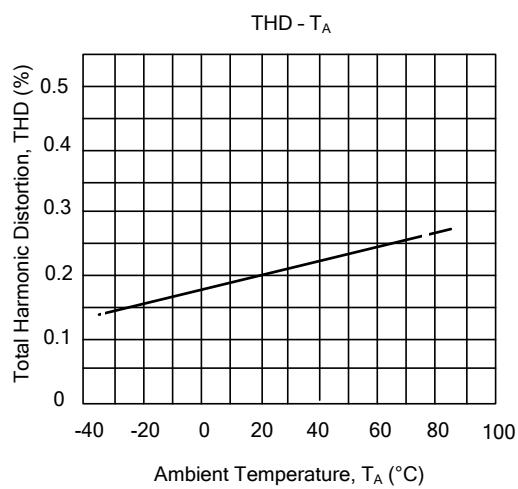

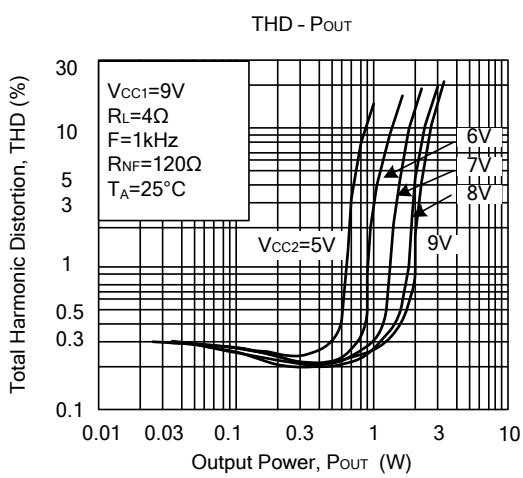

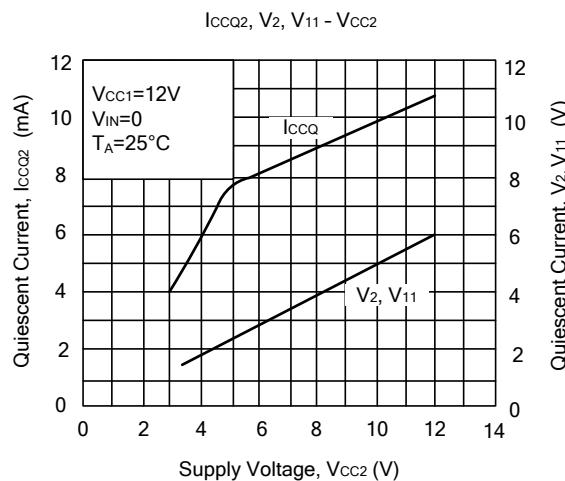

■ TEST CIRCUIT

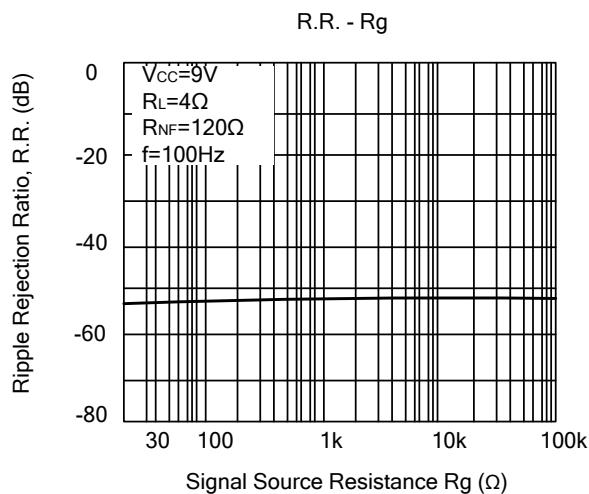

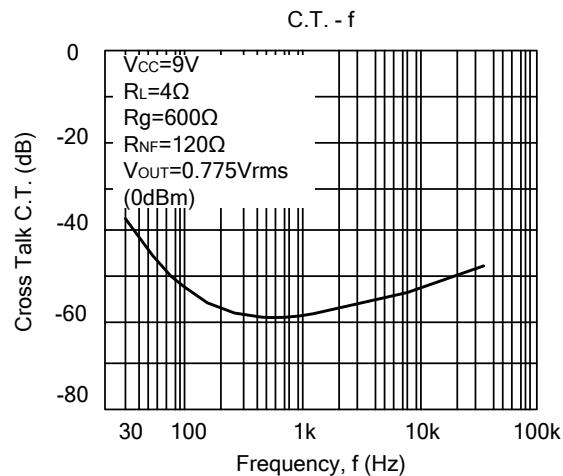

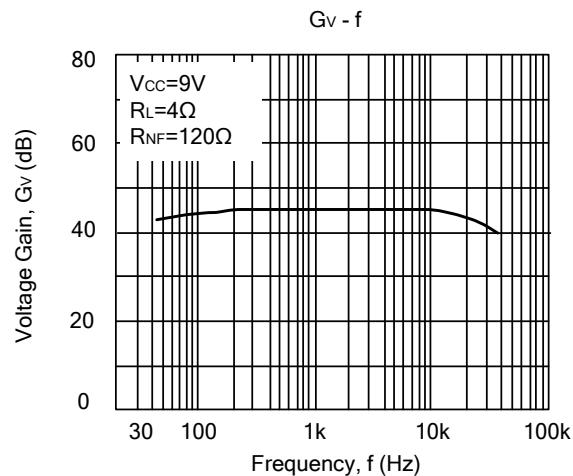

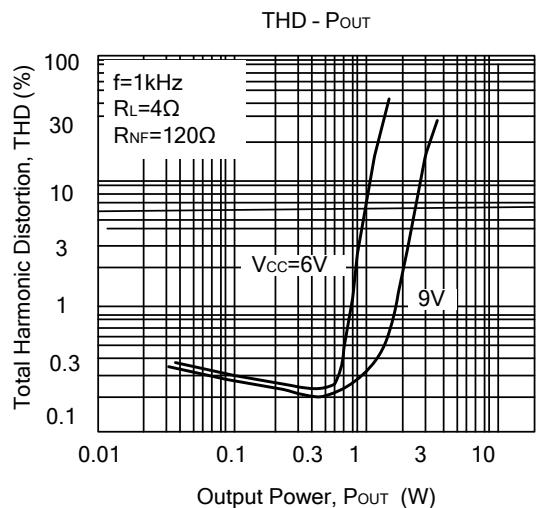

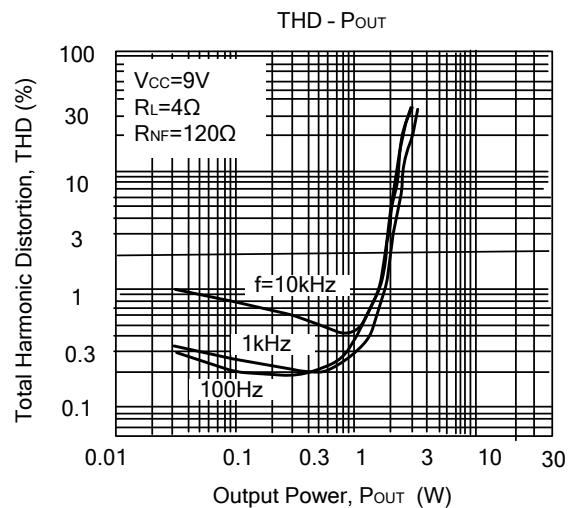

():For SOP-20 Package

- Notes:
1. This IC can be used without coupling capacitor (C_{IN}). If volume slide noise occurred by input offset voltage is undesirable, it needs to use the capacitor (C_{IN}).
 2. The condenser between the pin1 and the GND (C11) is for reducing pop noise when the power ON / OFF switch (SW1) is set to ON / OFF.
