

PA3427

Preliminary

CMOS IC

2W STEREO AUDIO AMPLIFIER

DESCRIPTION

The UTC **PA3427** is a stereo audio speaker operated on a single 5V supply. It is capable of delivering 2W of output power per channel in Bridge-Tied Load mode into 4Ω load with less than 1% THD+N.

Two terminals (GAIN0 and GAIN1) can configure and control the amplifier gain. In order to simplify the design of audio system in the notebook application, the two modes of Bridge-Tied Load (BTL) and Single-End (SE) mode drive the speakers and headphone respectively. The UTC **PA3427** supports two input paths to choose two different amplitude AC signals through setting HP/LINE pin.

The UTC **PA3427** is suitable for applications, such as stereo power amplifiers of notebooks or desktop computers, and multimedia monitors.

■ TYPICAL APPLICATION CIRCUIT

Application Circuit Using Differential Inputs

Note: 1µF ceramic capacitor must be placed much closely to the IC. For filtering lower frequency noise signals, a larger electrolytic capacitor of 10µF or greater should be placed as close as possible to the audio power amplifier.

■ TYPICAL APPLICATION CIRCUIT(Cont.)

Application Circuit Using Single-Ended Inputs

Note: 1µF ceramic capacitor should be placed as close as possible to the IC to filter the higher-frequency noise.

2. Gain setting (VS Gain0, Gain1 and R_i, SE/BTL)

Gain setting is determined by GAIN0 and GAIN1. The gains listed in the next table are realized by changing the taps on the input resistors inside the amplifier which will cause the internal input impedance(R_i) to be dependent on the gain setting as we can see listed in the next table.
