

C_L CAPACITOR-LESS 500mA LOW POWER CONSUMPTION HIGH SPEED LDO REGULATOR

DESCRIPTION

The UTC LR9203 is a CMOS-based low dropout regulator with high output voltage accuracy, low dropout, high PSRR and low quiescent current. The devices can provide stable output voltages even without a load capacitor C_L.

The C_L capacitor-less is possible because phase compensation is carried out internally unlike other LDOs where it is done externally. Since the output capacitor and noise bypass capacitor are able to be reduced, so saving the board design space.

When a C_L capacitor is used, the IC can discharge the electric charge stored at the output capacitor through the internal switch while in standby state, and as a result the V_{OUT} quickly returns to the V_{SS} level.

2. $V_{OUT(E)}$: Effective output voltage (i.e. the output voltage when " $V_{OUT(T)}+1.0V$ " is provided at the V_{IN} pin while maintaining a certain I_{OUT} value.)

3. $V_{OUT(T)}$: Nominal output voltage.

4. Characteristics of the actual $V_{OUT(E)}$ by setting output voltage is shown in the voltage chart.

5. $V_D=V_{IN1}(Note\ 7)-V_{OUT1}(Note\ 6)$

6. V_{OUT1} is a voltage equal to 98% of the output voltage whenever an amply stabilized $I_{OUT}\{V_{OUT(T)}+1.0V\}$ is input.

7. V_{IN1} is an input voltage when V_{OUT1} appears at the V_{OUT} pin while the input voltage is gradually decreased.

8. E-1: DROPOUT VOLTAGE (Refer to Voltage Chart.)
