LINEAR INTEGRATED CIRCUIT

HIGH PERFORMANCE CURRENT MODE PWM CONTROLLERS

DESCRIPTION

The UTC **UC1842A/1843A** are high performance fixed frequency current mode controllers that specifically designed for Off-Line and DC to DC converter applications with minimal external parts count.

The differences between **UC1842A** and **UC1843A** are the under-voltage lockout thresholds. The **UC1842A** ideally suited to off-line applications with UVLO thresholds of 16V_(ON) and 10V_(OFF), and **UC1843A** has UVLO thresholds of 8.4V_(ON) and 7.6V_(OFF) for lower voltage applications.

FEATURES

- * Operation output switching frequency up to 500 kHz
- * Automatic feed forward compensation
- * Latching PWM for cycle-by-cycle current limiting
- * High current totem pole output
- * Internally trimmed reference with under voltage lockout
- * UVLO with hysteresis
- * Low startup and operating current

PIN CONFIGURATION

PIN DESCRIPTION

PIN NO	PIN NAME	FUNCTION
1	Compensation	Error amplifier output, this pin is made available for loop compensation.
2	V_{FB}	Voltage Feedback, the inverting input of the Error Amplifier. It is normally connected to the switching power supply output through a resistor divider.
3	I_{SENSE}	A voltage proportional to inductor current is connected to this input. The PWM uses this information to terminate the output switch conduction.
4	R_T/C_T	The Oscillator frequency and maximum output duty cycle are programmed by connecting resistor R_T to V_{REF} and capacitor C_T to ground. Operation to 1 MHz is possible.
5	GND	Power ground.
6	Output	This output directly drives the gate of a power MOSFET. Peak currents up to 1A are sourced and sunk by this pin. The output switches at one-half the oscillator frequency.
7	V_{CC}	Positive supply.
8	V_{REF}	Reference output, provides charging current for capacitor C_T though resistor R_T .
