## LINEAR INTEGRATED CIRCUIT

### HIGH PERFORMANCE CURRENT MODE PWM CONTROLLERS

#### DESCRIPTION

The UTC **UC1844/1845** are high performance fixed frequency current mode controllers that specifically designed for Off-Line and DC to DC converter applications with minimal external parts count.

The differences between **UC1844** and **UC1845** are the under-voltage lockout thresholds. The **UC1844** ideally suited to off-line applications with UVLO thresholds of 16V<sub>(ON)</sub> and 10V<sub>(OFF)</sub>, and **UC1845** has UVLO thresholds of 8.4V<sub>(ON)</sub> and 7.6V<sub>(OFF)</sub> for lower voltage applications.

#### FEATURES

- \* Operation output switching frequency up to 500 kHz
- \* Automatic feed forward compensation
- \* Latching PWM for cycle-by-cycle current limiting
- \* High current totem pole output
- \* Internally trimmed reference with under voltage lockout
- \* UVLO with hysteresis
- \* Low startup and operating current

## PIN CONFIGURATION

## PIN DESCRIPTION

PIN NO	PIN NAME	FUNCTION
1	Compensation	Error amplifier output, this pin is made available for loop compensation.
2	$V_{FB}$	Voltage Feedback, the inverting input of the Error Amplifier. It is normally connected to the switching power supply output through a resistor divider.
3	$I_{SENSE}$	A voltage proportional to inductor current is connected to this input. The PWM uses this information to terminate the output switch conduction.
4	$R_T/C_T$	The Oscillator frequency and maximum output duty cycle are programmed by connecting resistor $R_T$ to $V_{REF}$ and capacitor $C_T$ to ground. Operation to 1 MHz is possible.
5	GND	Power ground.
6	Output	This output directly drives the gate of a power MOSFET. Peak currents up to 1A are sourced and sunk by this pin. The output switches at one-half the oscillator frequency.
7	$V_{CC}$	Positive supply.
8	$V_{REF}$	Reference output, provides charging current for capacitor $C_T$ though resistor $R_T$ .

Notes: 1. Low duty cycle pulse techniques are used during test to maintain junction temperature as close to ambient as possible.

2. This parameter is measured at the latch trip point with  $V_{FB}=0V$ .

3. Comparator gain is defined as:  $A_V = \frac{\Delta V \text{ Output Compensation}}{\Delta V \text{ Current Sense Input}}$

4. Adjust  $V_{CC}$  above the startup threshold before setting to 15V.
