

8-CHANNEL ANALOG MULTIPLEXER/DEMULITPLEXER WITH INJECTION-CURRENT EFFECT CONTROL

TSSOP-16

■ DESCRIPTION

The **U74HC4851** contains an 8-channel analog multiplexer/demultiplexer with injection-current effect control, which has excellent value in automotive applications where voltages in excess of normal supply voltages are common.

The injection-current effect control allows signals at disabled analog input channels to exceed the supply voltage without affecting the signal of the enabled analog channel. This eliminates the need for external diode/resistor networks typically used to keep the analog channel signals within the supply-voltage range.

■ FEATURES

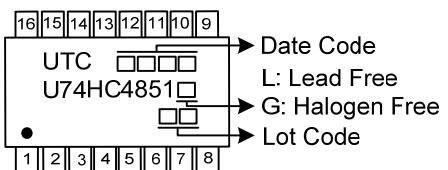

- * Injection-Current cross coupling<1mV/mA
- * Low crosstalk between switches
- * 2V to 6V V_{CC} Operation
